Notes:  
1. All section properties and ASD flexural strengths are calculated in accordance with AISI S100-2017, AISI S100-2012 and AISI S100-2008.  
2. Loads shown in tables are uniformly distributed superimposed loads in psf. Span length assumes center-to-center spacing of supports. Tabulated loads shall not be increased for moment, clear span dimensions.  
3. Working Moment Formula used for beam design:  $M = wL^2/8$  for single span,  $M = wL^2/16$  for two span,  $M = wL^2/24$  for three span.

Web crippling and shear have not been accounted for in these tables. Required bearing should be determined based on specific span conditions.

**Note**  
ANSI/AISC C-307 permits the use of Grade 80 steel for composite deck, but it limits the yield strength for determining composite deck slab strength to 50 ksi. Therefore for Grade 80 steel, 50 ksi values are used.

**Notes**  
1. Because of the profile of the embossments, there is no gain in strength for the composite deck slab when the deck gets thicker than 20 ga. However, the construction spans do get longer for 18 and 16 ga deck.  
2. ANSI/AISC C-307 permits the use of Grade 80 steel for composite deck, but it limits the yield strength for determining composite deck slab strength to 50 ksi. Therefore for Grade 80 steel, 50 ksi values are used.

**Note**  
ANSI/AISC C-307 permits the use of Grade 80 steel for composite deck, but it limits the yield strength for determining composite deck slab strength to 50 ksi. Therefore for Grade 80 steel, 50 ksi values are used.

**Notes**  
1. Because of the profile of the embossments, there is no gain in strength for the composite deck slab when the deck gets thicker than 20 ga. However, the construction spans do get longer for 18 and 16 ga deck.  
2. ANSI/AISC C-307 permits the use of Grade 80 steel for composite deck, but it limits the yield strength for determining composite deck slab strength to 50 ksi. Therefore for Grade 80 steel, 50 ksi values are used.
